Code: **JHCC-AR**  
Adopted: 10/18/89  
Readopted: 4/15/09  
Orig. Code(s): JHCC-AR

## **Procedures for Dealing with Students Having AIDS, HIV or HBV**

Although HIV, AIDS and HBV<sup>1</sup> are serious illnesses, the risk of contracting the disease in a school setting is extremely low. HIV and HBV are not spread from one person to another by casual social contact. Spread occurs when a body fluid such as blood or semen is introduced through broken skin or onto the mucous membranes of the eye, mouth, vagina or rectum. Specific methods for the spread of HIV or HBV are sexual contact, sharing of intravenous needles and transfusion of contaminated blood or blood products.

If any risk of contagion in the school setting exists, it would be limited to situations where open skin lesions or mucous membranes would be exposed to blood from an infected person. One example is a teacher providing first aid for a bleeding injury and getting blood into an open sore on his/her hand. Another example is student exposing other students by biting, spitting or scratching or other oral contact.

HIV, AIDS and HBV students may be at increased risk of serious illness if exposed to certain infections such as chickenpox, measles, tuberculosis, and herpes simplex.

### **Basic Assumptions**

Any procedure must be based on a set of assumptions that give credibility to the process. The following are among the assumptions that underlie this procedure:

1. All children in Oregon have a constitutional right to a free public education;
2. Because of the ways that the disease is transmitted, most children with an HIV, AIDS and/or HBV diagnosis pose no health risk if appropriate procedures are followed;
3. As a general rule, an infected child is entitled to remain in a regular classroom setting, be eligible for all rights, privileges and services provided by law and by Board policy;
4. Decisions regarding educational programs and school attendance will be made on a case-by-case basis, taking into consideration all available information on the immediate case;
5. The need for confidentiality is paramount because of the potential for social isolation should a child's condition become known to others.
