

Administering Injectable Medicines to Students *

In order to ensure the health and well-being of district students who may experience severe allergic reactions or suffer severe hypoglycemia, epinephrine and glucagon injections may be administered to students by trained staff in emergency situations when a licensed health care professional is not immediately available.

All requests for the district to administer injectable medication to a student shall be made by the parent in writing. Requests shall be accompanied by the physician's order for administering epinephrine and/or glucagon. A prescription label will be deemed sufficient to meet the requirements for a physician's order for epinephrine or glucagon.

The district may designate staff authorized to administer epinephrine and glucagon. Training shall be provided as required by law in accordance with approved protocols as established by Oregon Department of Human Services, Health Services. Staff designated to receive epinephrine and glucagon training shall also receive bloodborne pathogens training. A current first aid and CPR card will also be required.

Injectable medication will be handled, stored, monitored, disposed of and records maintained in accordance with established district regulations governing administering noninjectable medicines to students.

The superintendent will ensure student health management plans are developed as required by training protocols, maintained on file and pertinent health information is provided to district staff as appropriate. Such plans will include provisions for responding to emergency situations including those occurring during curricular and extracurricular activities held after regular school hours and on or off district property.
